

# DATA WAREHOUSE IMPLEMENTATION & BI REPORTING

## ABOUT THE CLIENT

Client is one of the **fastest growing restaurant chains** in Saudi Arabia, with more than 300 branches

### SITUATION

- Client **had information stored in multiple disjoint databases** which made data reconciliation and **reporting very difficult** and tedious
- Client partnered with Merilytics to **create a robust data warehouse** that will be the single source of truth for sales, marketing, and customer data and built dashboards to enable management get a holistic view of the key trends

### VALUE ADDITION

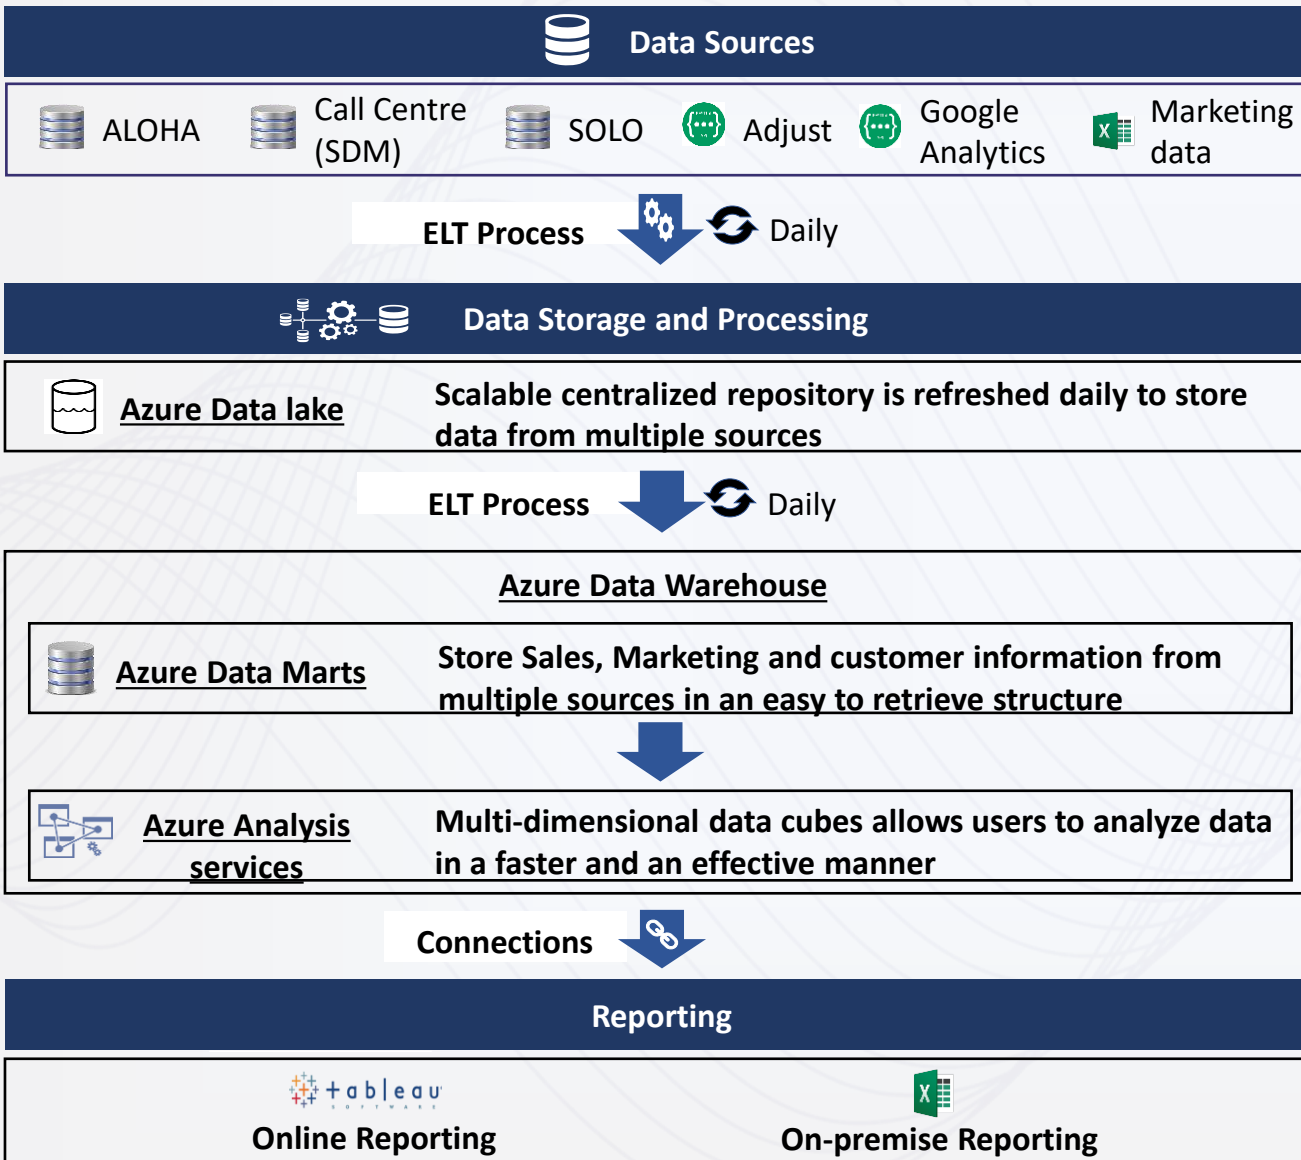

- Built a **sustainable and scalable** cloud-based **data infrastructure on Azure** which provides a readily available single source of truth for reporting or analysis
- Performed a **data reconciliation** exercise to understand the current variance and identify reliable sources of data for the data warehouse
- Established a **unique customer identification mechanism** that would help the marketing team understand customer behavior
- Built **self-service dashboards on Tableau** to provide insights into trends in sales performance, marketing spend, and customer engagement

### IMPACT

- The consolidated single repository for all sales, marketing, and customer data **enabled the client to have easy access to reliable and reconciled data** for reporting purposes
- The reconciliation exercise helped in providing **accurate and reliable data** for consumption
- The self-service Tableau dashboards **provided quick access to KPI trends** through visualizations for key performance metrics
- Unique customer identification mechanism **helped the marketing team understand customer behavior** and evaluate performance of promotion campaigns

# APPROACH & METHODOLOGY

## Data lake processes

- **Daily ELT processes** to support **multiple data sources** and **perform data loads on to the data lake**
- **Daily incremental loads** using pipelines in data factories to check last 10 days of data from Aloha & SDM
- **Mobile engagement data** on an hourly basis is accessed from Adjust through Amazon S3 and **website data** is captured daily by Google API

## Data warehouse processes

- Daily ELT process to integrate data lake with data warehouse using data factory pipelines. **Data processing to create data marts** with clean fact and dimension level information.
- **Alerts and notifications** over email to check for successful loads for each pipeline and audit checks to ensure accurate data transfer.
- **Customized tabular model** to support the reporting requirements

## Reporting Processes

- **“Ready-to-serve”** reporting infrastructure for visualization using **Tableau**
- Provide **quick self-serve reporting** and data access to business users
