

Data warehouse and BI infrastructure design and implementation

Healthcare provider focused on women and maternal health

- Built a scalable enterprise data warehouse on Azure platform to accommodate data from multiple data sources
- Built Power BI reporting suite to analyze the performance of various Practices

Setting up cloud-based data warehouse and reporting suite

Situation

- Opportunity to build the BI reporting infrastructure to enable more efficient and reliable reporting for Senior Leadership team
- Partnered with client to set up an Azure-based Enterprise Datawarehouse and develop automated performance dashboards

Accordion Value Add

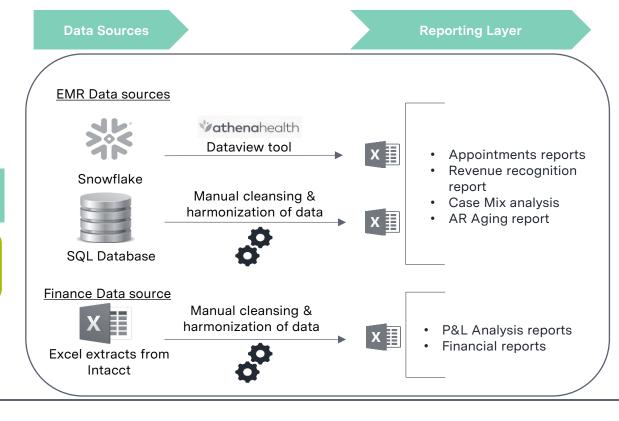

- Analyzed the EMR data (multiple data sources) and Accounting data (Intacct) to identify the relevant KPIs
- Built an Enterprise Datawarehouse (on Microsoft Azure platform) connecting different data sources through data pipelines (in Azure Data Factory), cleansed and transformed the raw data as per business requirements
- Created tabular data models in Azure SQL database to create ready-to-serve data marts for analytical and reporting purposes
- Developed automated Power BI dashboards on top of the tabular data models to analyze the performance across different Practices
- Incorporated automated data validation and reconciliation rules at every step across the entire ETL process to ensure accuracy and consistency in data

Impact

- Advanced Enterprise Datawarehouse enabled the availability of clean and validated data off the shelf across the company on near real time basis
- Data integration of multiple EMR systems enabled the client to have consistent reporting across multiple entities
- Automated Power BI dashboards provided visibility for the Senior Leadership team into the key performance metrics dashboards with consistent and accurate performance KPIs across different practices

Prior reporting processes

Observations on prior reporting plan:-

- Extracting data from different sources is time consuming and inefficient
- Data sources across various entities are different with varying architecture of each database and inconsistent dimensions
- Non-scalable architecture: cumbersome to add a new data source with different data accessibility method

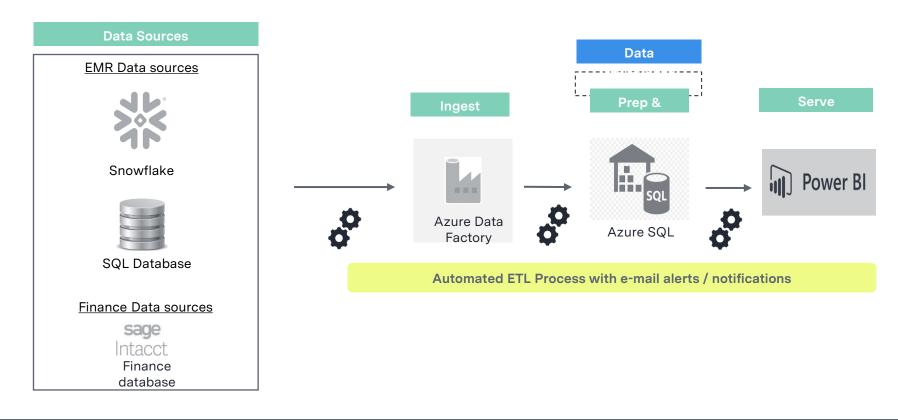

Data, Reporting and Analytics

Data Structures

- Lack of consistency of data sources and no standardized reporting/ KPIs across different entities
- Ad-hoc reporting based on needs from various teams
- Prone to errors as the data is manually updated
- Lack of availability of real-time data
- Data security challenges while extracting the data from different systems and reports distribution

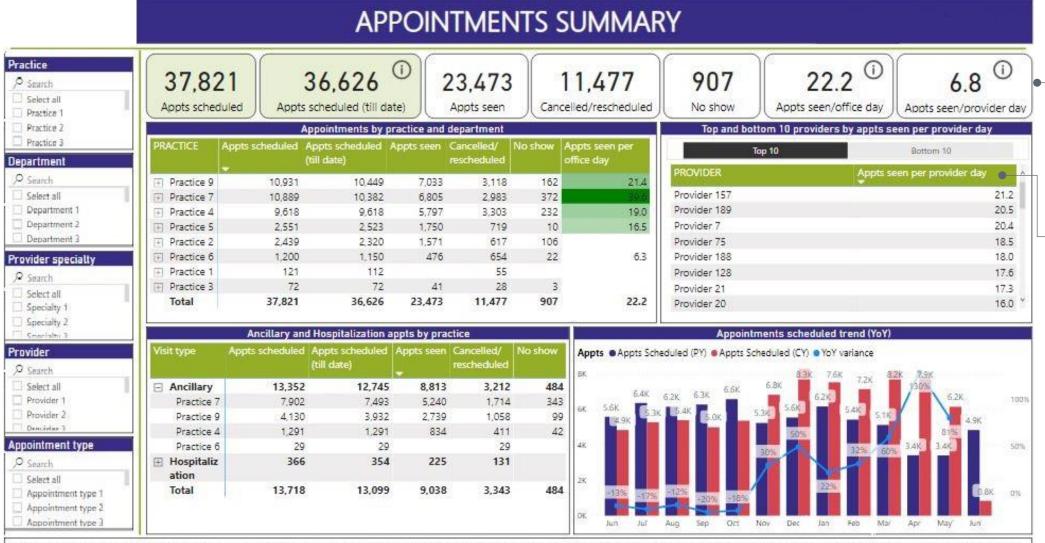

New reporting flow after BI infrastructure implementation

- Built an Enterprise Datawarehouse connecting different data sources through data pipelines and transformed raw data as per business requirements
- Developed an automated ETL process to load the data into data warehouse daily and configured e-mail alerts/notifications to monitor the overall ETL process
- Incorporated automated data validation and reconciliation rules at every step across the entire ETL process to ensure accuracy and consistency in data
- Created Tabular data models on Azure SQL database and developed ready-to-serve data marts for analytical and reporting purposes.
- Developed Power BI dashboards on top of the data models to monitor and track business performance.

Illustrative dashboard - Appointments

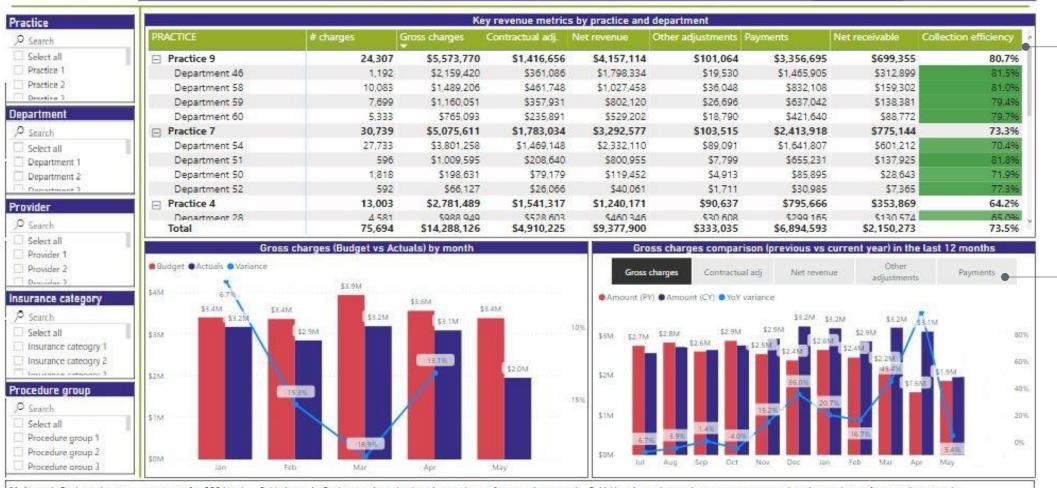

KPI cards to summarize various appointments metrics

Buttons to toggle between list of Top 10 and Bottom 10 Providers based on Appointments seen per provider day

Notes: 1. Appointments are categorized into Visit, Hospitalization and Ancillary based on the Provider mapping and department name 3. Provider days/Office days are only calculated for office locations 4. Appts seen in office locations are only considered for calculating appts seen per office day/provider day. 5. YoY variance is not shown for ongoing month

Illustrative dashboard - Revenue

REVENUE SUMMARY - PRACTICE

Matrix to give insights into key revenue metrics by Practice and various Departments in each Practice

Buttons to toggle between different revenue metrics. Corresponding previous year numbers are also provided with YoY variance %

6

Notes: 1. Budget charges are present for 2021 only. 2. Variance in Budget vs Actuals chart is not shown for ongoing month. 3. YoY variance in previous vs current year chart is not shown for ongoing month.

7 day rolling average trend chart to capture payments received trend in last 90 days

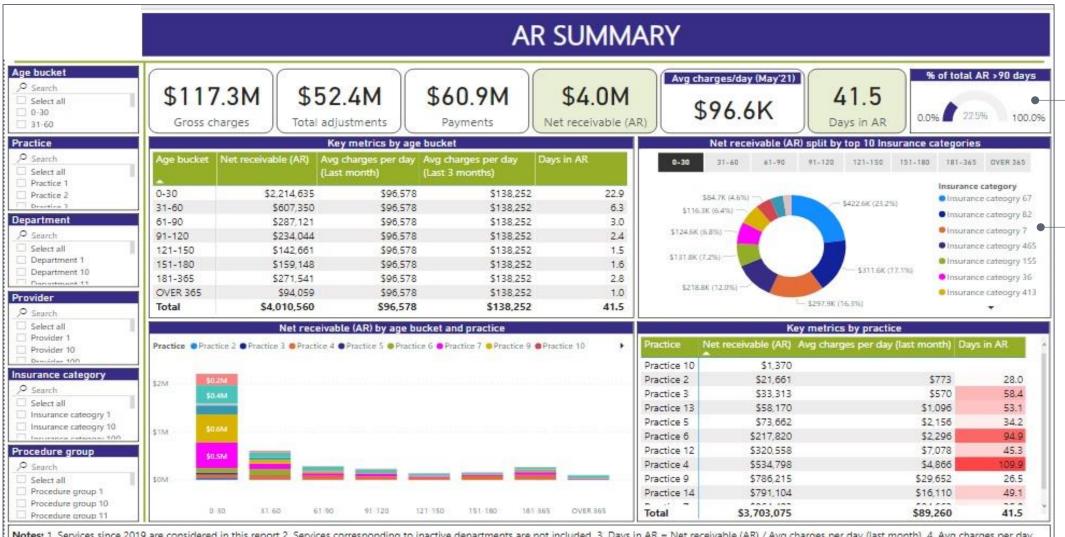

Visual to portray payments trend for Top insurance categories

7

Notes: 1. All the visuals shown in this tab have payment post date as the x-axis 2. Payments post date is the date in which payment is entered in Athena 3. *Service from date slicer does not interact with this chart. 4. Rolling 7 day avg payments is calculated as the payments received in the last 7 days / 7

Illustrative dashboard - AR Ageing

KPI cards to capture key AR Aging metrics

Pie chart to portray the Balance receivables for Top 10 Payors based on Ageing bucket

Notes: 1. Services since 2019 are considered in this report 2. Services corresponding to inactive departments are not included 3. Days in AR = Net receivable (AR) / Avg charges per day are calculated as Gross charges/no of days in the last calendar month. 5. Days in AR is not calculated if there are no charges billed in the last month. 6. 'Others' procedure group corresponds to unmapped procedure codes
